

# 贵州梵净山棘蝇属三新种\*

## (双翅目: 蝇科)

薛万琦 陈宏伟 崔永胜

(沈阳师范学院昆虫研究所 沈阳 110036)

本文报告了采自中国贵州省梵净山的棘蝇属 (*Phaonia* Robineau-Desvoidy, 1830) 三新种: 瘦角棘蝇 *P. antenniangusta* sp. nov., 梵净山棘蝇 *P. fanjingshana* sp. nov., 侧突棘蝇 *P. laticrassa* sp. nov.。模式标本保存于沈阳师范学院昆虫研究所。

### 1 瘦角棘蝇 *Phaonia antenniangusta* 新种 (图 1~3)

雄虫: 体长 5.5 mm。

复眼具密长纤毛; 额宽约等于后单眼外缘间距或触角第三节宽的 1.5 倍, 下眶鬃 9~10 对, 达于单眼三角处, 间额黑, 宽约为一侧额宽的 2 倍, 侧额、侧颜及颊具灰色粉被, 侧颜宽约等于触角第三节宽; 触角基部黑, 第二节端部和第三节黄色, 第三节长约为宽的 3.5 倍, 芒羽状, 最长芒毛长约为触角宽的 1.2 倍; 口上片不突出, 髭角位于额角之后, 颊前上缘具 4 根上倾鬃列, 颊高约为眼高的 1/3 强, 颊毛及下后头毛均黑; 喙短, 前颊具粉被, 长为高的 2 倍, 下颏须棕色, 端部黄色, 略长于中喙。

图 1~3 瘦角棘蝇 *Phaonia antenniangusta* sp. nov. ♂

1. 第五腹板腹面; 2. 肛尾叶后面; 3. 尾器侧面

胸暗黑, 具灰色粉被, 盾片具不明显的 4 黑条; 中鬃 0+1, 背中鬃 2+3, 翅内鬃 0+2,

翅前鬃长约为后背侧片鬃长的 1.8 倍, 背侧片具毛, 前胸基腹片, 前胸侧板中央凹陷、翅侧片下侧片及后气门前肋均裸, 腹侧片鬃 1:2; 前气门黄色, 后气门褐色; 小盾不变异色。

翅透明, 带棕色; 前缘基鳞黑, 前缘刺短小, 亚前缘脉呈弓把形弯曲, 径脉结节背、腹面均裸,  $r_{4+5}$  和  $m_{1+2}$  脉直, 横脉直, 附近无暗晕, 平衡棒和腋瓣均淡黄色。

足黑色; 前足股节具完整的后背和后腹鬃列, 端半部具 1 背鬃列, 前足胫节无中位后鬃; 中足股节具完整刚毛状的后腹鬃列, 中胫后鬃 2; 后足股节端部具前腹鬃列, 无后腹鬃, 后足胫节前腹鬃 2, 前背鬃 2, 后背鬃 1。

腹部近圆形, 具均匀的灰至灰棕色粉被, 第三、四背板黑色正中条明显, 其宽度约等于各自背板长的 1/5, 第五背板正中条不明显, 各背板无闪光斑; 第一腹板裸。

雌虫: 不详。

正模♂, 贵州省梵净山, 1 200 m, 1993. IX. 6, 陈宏伟采。

新种近似于肥角棘蝇 *Phaonia antennicrassa* Xue, 1988<sup>[1]</sup>; 但新种触角第三节黄色, 下颚须棕色, 多数芒毛长超过触角第三节宽; 背侧片具毛; 后足胫节前背鬃 2; 腹部各背板的正中条侧缘平行; 尾器亦不同。

## 2 梵净山棘蝇 *Phaonia fanjingshana* 新种 (图 4~7)

雄性: 体长 8.0 mm。

复眼具参差不齐的疏短纤毛; 额宽约为头宽 1/13 或略宽于触角第三节宽, 间额宽为一侧额宽的 2 倍, 下眶鬃 7~8 对, 上升至额上部的 2/3, 往上部去变细小, 无上眶鬃, 侧额、侧颜及颊具灰棕色粉被, 侧颜宽约为触角第三节宽的 3/5; 触角黑, 第三节长约为第二节长的 3 倍, 芒长羽状, 最长芒毛略长于触角第三节宽; 口上片不突出, 髭角位于额角之后, 颊毛黑, 颊前上缘具 2~3 根上倾的鬃, 颊高约为眼高的 1/5, 下后头毛全黄; 喙粗短, 前额长为高的 2 倍, 下颚须黑色, 长于中喙。

胸暗黑, 具灰色粉被, 盾片具明显的 4 黑条, 内侧条达于小盾沟; 中鬃 0+1, 背中鬃 2+3, 翅内鬃 0+2, 翅前鬃明显长于前背侧片鬃, 约为后背侧片鬃长的 2.5 倍, 前胸基腹片、前胸侧板中央凹陷、背侧片、翅侧片、下侧片及后气门前肋均裸, 腹侧片鬃 1:2; 前气门黄色, 后气门黑褐色; 小盾全黄, 至多在小盾沟附近为褐色。

翅带淡棕色, 透明; 前缘基鳞棕色, 前缘刺短小, 亚前缘脉呈弓把形弯曲, 径脉结节背、腹面均裸,  $r_{4+5}$  和  $m_{1+2}$  脉直,  $m-m$  横脉中后部内陷, 各横脉附近无暗晕, 平衡棒和腋瓣均淡黄色。

足除前足股节端部背面、基节和跗节黑色外, 余均黄色; 前足胫节无中位后鬃; 中足股节基半部具 1 行前鬃列, 基半部后腹鬃长于该节横径, 从中部往端部去明显短而细, 端位前背鬃 1, 后背鬃 3, 中胫后鬃 3; 后足股节前腹和前背鬃列完整, 基半部具后腹鬃列, 后足胫节前腹鬃 4, 前背鬃 2, 后背鬃 1; 各足爪和爪垫中等, 跗节无感觉毛。

腹部圆形; 橄榄黑色, 各背板具正中狭黑条, 第一、二合背板后半部具灰褐色粉被, 第三、四背板中部具宽大的近三角形的暗褐色粉被斑, 边缘不清楚, 背面观第三背板前方两侧具浓厚的蓝灰色粉被, 无变色斑, 背面观第四背板前侧角具小块蓝灰色粉被, 其

内方具变色斑，第五背板粉被暗灰色，正中黑条在前半部短而狭，其两侧略具小块暗褐色粉被斑，各背板的腹侧面和各腹板具均匀浓密的青灰色粉被；第一腹板裸，第二腹板基半部具略密的缨状毛，第二至四腹板后缘分别具 1 对强鬃。

雌性：不详。

正模♂，贵州省梵净山，800 m，1993. IX. 5，崔永胜采。

新种主要外形特征近似于广东棘蝇 *Phaonia guangdongensis* Xue et Liu, 1985<sup>[2]</sup>；但新种雄虫复眼纤毛疏短，参差不齐，额宽于触角第三节宽，颊前上缘具 2~3 根上倾鬃；小盾几乎全黄；后足股节基半部后腹鬃细长；腹部第三、四背板具宽大的近三角形暗褐色斑；侧尾叶后缘和肛尾叶端缘较平直（肛尾叶内侧突有些向内方弯，从后腹面观可见端缘亦不平）等即可区别。

图 4~7 梵净山棘蝇 *Phaonia fanjingshana* sp. nov. ♂  
4. 腹部背面；5. 第五腹板腹面；6. 肛尾叶后面；7. 尾器侧面

### 3 侧突棘蝇 *Phaonia laticrassa* 新种 (图 8~11)

雄虫：体长 3.7 mm。

复眼实际裸；额宽约为头宽 1/11 或略宽于触角第三节宽，间额略宽于一侧额，额下半部具 4 对下眶鬃，单眼三角下方具 1 对小的后倾上眶鬃，额、侧颜及颊具薄的灰色粉被，侧颜宽约为触角第三节宽的 3/5；触角黑，第三节长为宽的 4 倍，芒羽状，最长芒毛长约等于触角第三节宽；口上片位于髭角一线上，髭角略在额角之后，颊前上缘具 1 列上倾的鬃，颊高约为眼高的 1/5，颊毛及下后头毛黑色；喙正常，前额长为高的 3.2 倍，下颏须黑色，约等于前额长。

胸黑，具灰色粉被，盾片粉被灰棕色，具 4 黑条；中鬃 0+1，背中鬃 2+3，翅内鬃 0+2，翅前鬃至少为后背侧片鬃长的 2 倍，前胸基腹片、前胸侧板中央凹陷、背侧片、翅侧片、下侧片及后气门前肋均裸，腹侧片鬃 1:2；前气门暗棕色，后气门黑褐色；小盾不变异色。

翅淡棕色；前缘基鳞黑棕色，前缘刺明显，亚前缘脉呈弓把形弯曲，径脉结节背、腹面均裸， $r_{4+5}$ 和 $m_{1+2}$ 脉直，横脉直，附近无暗晕，平衡棒和腋瓣均淡黄色。

足除胫节深棕外，余全黑；前足胫节无中位后鬃；中足股节后腹鬃列完整，往端部去变短，端位前背鬃1，后背鬃3，中胫后鬃2；后足股节前腹、前背和后腹鬃列完整，后足胫节前腹鬃2，前背鬃1，后背鬃1；各足爪和爪垫短小，跗节无感觉毛。

腹部近圆形；具棕色粉被和变色斑，第三背板正中黑色斑为长卵形，其宽度约等于该节长的 $1/3$ ，第四背板正中黑条狭，第五背板正中黑条为一线；第一腹板裸，第二至四腹板后端分别具1对壮鬃，第三、四腹板稍短，第五腹板较大，其侧叶内侧黄色。

图 8~11 侧突棘蝇 *Phaonia laticrassa* sp. nov. ♂

8. 腹部背面；9. 第五腹板腹面；10. 肛尾叶后面；11. 尾器侧面

雌虫：不详。

正模♂，贵州省梵净山，1 200 m，1993. IX. 6，陈宏伟采。

新种主要外形特征近似于日本、俄罗斯远东地区分布的 *Phaonia iozen* Shinonaga et Kano, 1971<sup>[3]</sup>；但新种雄虫复眼裸，间额存在，稍宽于一侧额，且具1对小的上眶鬃，触角第三节为第二节长的3~3.5倍；翅前鬃长于前背侧片鬃；股节全黑，后足股节后腹鬃列完整而细长，后足胫节前背鬃1；腹部第三背板的正中黑斑较宽等即可区别。

## THREE NEW SPECIES OF THE GENUS *PHAONIA* FROM FANJING MOUNTAIN, CHINA (DIPTERA: MUSCIDAE)

Xue Wanqi Chen Hongwei Cui Yongsheng

(Institute of Entomology, Shenyang Normal College Shenyang 110034)

**Abstract** The present paper deals with three new species of the genus *Phaonia* collected from Guizhou Province. Type specimens are deposited in the Institute of Entomology, Shenyang Normal College.

### 1 *Phaonia antenniangusta* sp. nov. (figs. 1~3)

Male: Body length 5.5 mm. Eyes densely covered with long ciliae; frons about equal in width to distance between exterior margins of posterior ocelli; 9~10 pairs of inferior orbitals; interfrontalia about twice as wide as parafrontalia; *ac* 0+1; *dc* 2+3; *pra* about 1.8 times of length of 2nd notopleural bristle; prosternum and beret bare; prostigma yellow; basicausta black; cross veins straight and unclouded; legs black;  $t_1$  without a medial *p* bristle;  $t_2$  with 2 *p* bristles; abdomen somewhat rotundate; Tg3 and Tg4 with distinct black median vittae, about equal in width to 1/5 of lengths of both tergites; all tergites without glitter pattern.

Female: Unknown.

Holotype ♂, Mt. Fanjing (27°55'N, 108°35'E), Guizhou Province, 1200m, Sept. 6, 1993, Chen Hongwei.

This new species is similar to *Phaonia crassa* Xue, 1988, but differs in: 3rd segment of antenna yellow, palpi orange; most of hairs on arista longer than width of 3rd segment of antenna; notopleura with hairs; 2 *ad* bristles on  $t_3$ ; lateral margins of median vitta of tergites parallel; and different terminalia.

### 2 *Phaonia fanjingshana* sp. nov. (figs. 4~7)

Male: Body length 8.0mm. Antennae black; arista long-plumose, longest hairs slightly longer than width of 3rd segment of antenna; gena about equal in height to 1/5 of eye; hairs on metacéphalon entirely yellow; *ac* 0+1; *dc* 2+3; *pra* about 2.5 times as long as 2nd notopleural bristle; prosternum, notopleura and beret bare; prostigma yellow; wings slightly pale orange; radial node bare; near cross-veins unclouded; legs yellow except for distal part black on dorsal surface of  $f_1$ , and coxae and tarsi black;  $t_1$  without a medial *p* bristle;  $t_2$  with 3 *p* bristles;  $f_3$  with a row of *pv* bristles on the basal half;  $t_3$  with 4 *av*, 2 *ad* and 1 *pd* bristles; abdomen rotundate, olivaceous-black; middle of Tg3 and Tg4 each with

subtriangular wide-large dark brown pollinose spots, margins of spots indistinct; in dorsal view, anterolateral surface of Tg3 with dense bluish-grey pollen, without glinted pattern; anterolateral angle of Tg4 with a small bluish-grey pollinose area in dorsal view, interior surface of which with glinted pattern, first sternite bare; 2nd sternite with dense setaceous fringe on the basal half.

Female: Unknown.

Holotype ♂, Mt Fanjing (27°55'N, 108°35'E), Guizhou Province, 800m, Sept. 5, 1993, Cui Yongsheng.

This new species resembles *Phaonia guangdongensis*, Xue *et* Liu, 1985, but can be differentiated from the latter by as follows: ciliae of eyes sparse, short and uneven; frons wider than 3rd segment of antenna; antero-upper margin of gena with 2 to 3 upcurved setae; scutellum almost wholly yellow; *pv* bristles on basal half of  $f_3$  slender; 3rd and 4th tergites each with larger dark brown subtriangular spots; posterior margin of surstylus and apical margin of cercus fairly even and straight (entopleural process of cercus slightly inflected forward, so apical margin of cercus rather uneven in posteroventral view.)

### 3 *Phaonia laticrassa* sp. nov. (figs. 8~11)

Male: Body length 3.7 mm. Frons-width about 1/11 of head-width; *ant* plumose; gena-height about 1/5 of height of eye; thorax black; *ac* 0+1; *dc* 2+3; *pra* at least 2 times of length of 2nd notopleural bristle; notopleura, prosternum, hypopleura and beret bare; basicosta dark orange; radial node bare; cross-veins straight and unclouded; legs black except for tibiae dark brown;  $t_1$  without a medial *p* bristle;  $f_2$  with a complete row of *pv* bristles and gradually shortening toward apex of  $f_2$ ;  $t_2$  with 2*p* bristles;  $f_3$  with complete rows of *av*, *ad* and *pv* bristles; abdomen subrotundate and with glitter pattern.

Female: Unknown.

Holotype ♂, Mt. Fanjing (27°55'N, 108° 35'E), Guizhou Province, 1200m, Sept. 6, 1993, Chen Hongwei.

This new species resembles *Phaonia iozen* Shinonaga *et* Kano, 1977, the latter occurs in the Far East of Russia and Japan, but differs in : eyes bare; interfrontalia present and slightly wider than a parafrontals; with a pair of small superior orbitals; 3rd segment of antenna about 3 to 3.5 times as long as 2nd segment; *pra* slightly longer than anterior notopleural bristle; femora entirely black; *pv* bristles on  $f_3$  thin, long and in a complete row;  $t_3$  with 1 *ad* bristle; black median stripe of Tg3 wider.
